Masrouf - User Manual

100% Local Family Budget Tracking App

1. Introduction & Total Privacy

Masrouf is a mobile personal budget application built for Tunisian families.
It runs 100% locally on your phone using SQLite: no internet, no external server.
All your financial data remains confidential on your physical device.
Masrouf features two separate roles: Standard User and Administrator.

2. Onboarding & Registration

Create your personal account using the registration form upon first launch.
A three-step onboarding assistant walks you through without forcing a budget.
Pick your preferred expense categories from the built-in system categories.
You will then arrive at the clean home dashboard in its initial zero state.

Budget Envelopes & Purchases

Envelope allocations and daily expense logging

3. Creating and Allocating Budget

Define a total budget in Tunisian Dinars for your selected custom date range.
Distribute the sum into your active envelopes with real-time balance check.
Total envelope allocations cannot exceed the specified overall budget.
Use "Copy Previous Period" to quickly re-apply your favorite budget distribution.

4. Logging Purchases and Simple Expenses

Record purchases in two visually distinct modes:
- Product Purchase: product catalog selection, quantity, and total price.
- Simple Expense: recurring bills, transit, rent, or utilities without products.
Instant suggestions help you pick existing items without creating duplicates.
Unit price is calculated in real time and compared to your last recorded purchase.

Product Catalog & Price Insights

Permanent photos, price history, and best store detection

5. Product Catalog and Camera Photos

The catalog features "Today’s Purchases" at the top alongside instant search.
Attach real photos to products via camera snapshot or gallery picker.
The shared ProductThumb component displays the image or fallback icon.
Images are copied to the permanent app directory with stable filenames.

6. Product Details & Best Store Indicator

The product sheet highlights the cheapest store where you bought the item.
A price history curve plots past unit prices across your recorded transactions.
Color banners tell you whether your latest purchase saved money or cost more.

Analytics, Points & Administration

Precise financial metrics, automated rules, and governance

7. Analytics & Rule-based Conclusions

The Analytics screen compares the current period against a prior identical span.
A proportional segmented bar visualizes your main expense categories.
An automatic rule engine (no AI) summarizes key habits and exceeded envelopes.
Calculations run in integer millimes to eliminate any floating-point rounding errors.

8. Points Gamification & Admin Space

Earn points when keeping within budget: Beginner, Saver, and Expert ranks.
The Admin space provides anonymous global metrics and category management.
Administrators have strictly no access to individual user budgets or purchases.
